ACTIVITY 5: AI TOOLS ACTIVITY

For this activity, I made use of ChatGPT to generate an image with an initial prompt of: “Create a fishtank.”

Attached below is the generated image it initially produces:

For the refined prompt, I used the following: “Add a zebra fish in the aquarium and a sea anemone.”

The resulting image is as follows:

The first image's sign that it was artificially generated are the lack of reflections of the fishes present on the glass. Another sign is that the goldfish on the lower right is anatomically incorrect, with fins sprouting on top of its head.

The difference present in the second picture aside from the addition of the zebra fishes and the sea anemone, as stated in the prompt, would share a similar nature with the first picture. There is a considerable lack of appropriate reflections of the fishes on the glass and a zebra fish without a proper head. The anatomically incorrect goldfish is also retained in the second generated image.

From a wider perspective, the photo could pass as an actual aquarium that is well maintained and taken care of by its owner. However, the minute details make it evident that the image does not occur naturally and more of an imitation.
